BIO-SKETCH

Spanish, born in 1957 in Larache [Morocco]. Full Professor of Genetics (University of Seville, **US**) PhD from **US** in 1983, completed his formation in Solar Energy Res. Institute (Denver, CO, USA), Darmstadt Technical University (DE) and NYU Medical Center (USA), and started his lab in 1991 in the Genetics Department (**US**). Moved in 2006 to CABIMER as co-founder and Vice-director.

His major research interests are RNA-mediated genome instability and recombinational DSB repair. His work has been pioneering in connecting RNA metabolism with DNA dynamics, and in the identification of R-loops and transcription-replication conflicts as a source of genome instability. His lab purified the THO complex uncovering a new function in mRNP biogenesis, R-loop-prevention and RNA-mediated genome instability, which initiated a new area of research. Lately, his lab uncovered new functions for known RNA-binding factors like UAP56/DDX39B, chromatin remodelers like SWI/SNF, FACT or SIN3A, DNA repair factors like BRCA2 or FANCD2, and recently for the DICER nuclease as suppressors of R-loops and RNA-mediated genome instability. In parallel, he has significantly contributed to the research on replication-born DNA break repair by sister-chromatid recombination, providing evidence for the role of cohesin and chromatin factors
